1.0 GENERAL DESCRIPTION

1.1 Introduction

HV121P01-101 is a color active matrix TFT LCD module using amorphous silicon TFT's (Thin Film Transistors) as an active switching devices. This module has a 12.1 inch diagonally measured active area with SXGA+ resolutions (1400 horizontal by 1050 vertical pixel array). Each pixel is divided into RED, GREEN, BLUE dots which are arranged in vertical stripe and this module can display 262,144 colors. The TFT-LCD panel used for this module is a low reflection and higher color type. Therefore, this module is suitable for Notebook PC. The DC/AC inverter for back-light driving is not built in this model.

Note) The output of the inverter may change according to the material of the reflector.

Notes: 1. The supply voltage is measured and specified at the interface connector of LCM. The current draw and power consumption specified is for 3.3V at 25 ℃.

The test pattern of power supply current

- a) Typ: Window XP pattern @ 50Hz
- b) Max: Gray 28 @ vertical 2 skip line pattern
- 2. Reference value, which is measured with Samsung Electric SIC-180 Inverter. (VBL Min is value at IBL Min and VBL Max is value at IBL Max)
- 3. Minimum value of lamp current: In case of current adjustment method
- 4. The lamp frequency should be selected as different as possible from the horizontal synchronous frequency and its harmonics to avoid interference which may cause line flow on the display.
- 5. For starting the backlight unit, the output voltage of DC/AC's transformer should be larger than the minimum lamp starting voltage. (1,050 Vrms at 25 $^{\circ}$ C, 1,310 Vrms at 0 $^{\circ}$ C) If an inverter has shutdown function it should keep its output for more than 1 second even if the lamp connector open. Otherwise the lamps may not to be turned on.
- 6. End of Life shall be determined by the time when any of the following is satisfied under continuous lighting at 25° C and IBL = 6.0[mA] Max Only.
 - Intensity drops to 50% of the Initial Value.
- 7. The typical value is calculated value for reference (VBL \times IBL). Max value adds a 10 % tolerance of typical value of Back light power.

4.0 OPTICAL SPECIFICATION

4.1 Overview

The test of Optical specifications shall be measured in a dark room (ambient luminance ≤ 1 lux and temperature = $25\pm2\,^\circ\text{C}$) with the equipment of Luminance meter system (Goniometer system and TOPCONE BM-5) and test unit shall be located at an approximate distance 50cm from the LCD surface at a viewing angle of Θ and Φ equal to 0° . We refer to Θ =0 (= Θ 3) as the 3 o'clock direction (the "right"), Θ =90 (= Θ 12) as the 12 o'clock direction ("upward"), Θ =180 (= Θ 9) as the 9 o'clock direction ("left") and Θ =270(= Θ 6) as the 6 o'clock direction ("bottom"). While scanning Θ and/or \emptyset , the center of the measuring spot on the Display surface shall stay fixed. The backlight should be operating for 30 minutes prior to measurement... VDD shall be 3.3+/- 0.3V at 25°C. Optimum viewing angle direction is 6 'clock.

- Notes: 1. Viewing angle is the angle at which the contrast ratio is greater than 10. The viewing angles are determined for the horizontal or 3, 9 o'clock direction and the vertical or 6, 12 o'clock direction with respect to the optical axis which is normal to the LCD surface (see FIGURE1 as below).
 - 2. Contrast measurements shall be made at viewing angle of ⊕ = 0 and at the center of the LCD surface. Luminance shall be measured with all pixels in the view field set first to white, then to the dark (black) state .
 Luminance Contrast Ratio (CR) is defined mathematically as CR = Luminance when displaying a white raster / Luminance when displaying a black raster.
 - 3. The color chromaticity coordinates specified in Table 4. shall be calculated from the spectral data measured with all pixels first in red, green, blue, and white. Measurements shall be made at the center of the panel.

Figure 2. White Luminance (Center) and Uniformity Measurement Locations (5 points & 13 points)

White luminance: Center Luminance of white is defined as luminance values of center 1 point. Luminance shall be measured with all pixels in the view field set first to white. This measurement shall be taken at the locations shown in FIGURE 2.

Uniformity of 5 points and 13 points : The White luminance uniformity on LCD surface is expressed as : \triangle Y5 = Minimum Luminance of five points / Maximum Luminance of five points (see FIGURE 2) , \triangle Y13 = Minimum Luminance of 13 points / Maximum Luminance of 13 points (see FIGURE 2.)

Figure 3. Response Time Testing

The electro-optical response time measurements shall be made as shown in FIGURE 3 by switching the data input signal ON and OFF. The times needed for the luminance to change from 10% to 90% is Td and 90% to 10% is Tr.

Figure 4. Cross Modulation Test Description

Test point of Y_A / Y_B : Point of Y_B (1225, 525)

Cross-Talk (%) =
$$\left| \frac{Y_B - Y_A}{Y_B} \right| \times 100$$

Where:

 ${
m Y_A}$ = Initial luminance of measured area (cd/m²) ${
m Y_B}$ = Subsequent luminance of measured area (cd/m²) The location measured will be exactly same position in both patterns

Cross-Talk of one area of the LCD surface by another shall be measured by comparing the luminance (Y_A) of a 25mm diameter area, with all display pixels set to a gray level, to the luminance (Y_B) of that same area when any adjacent area is driven dark (Refer to FIGURE 4).

9.0 POWER SEQUENCE

To prevent a latch-up or DC operation of the LCD module, the power on/off sequence shall be as shown in below

- T1 ≤ 10 ms
- lacktriangle 0 \leq T2 \leq 50 ms
- 200ms ≤ T3
- \bullet 0 \leq T4
- \bullet 0 \leq T5
- \bullet 0 \leq T6 \leq 10ms
- \bullet 150ms \leq T7

Notes: 1. When the power supply VDD is 0V, Keep the level of input signals on the low or keep high impedance.

2. Do not keep the interface signal high impedance when power is on. Back Light must be turn on after power for logic and interface signal are valid.

12.0 HANDLING & CAUTIONS

- (1) Cautions when taking out the module
 - Pick the pouch only, when taking out module from a shipping package.
- (2) Cautions for handling the module
 - As the electrostatic discharges may break the LCD module, handle the LCD module with care. Peel a protection sheet off from the LCD panel surface as slowly as possible.
 - As the LCD panel and back light element are made from fragile glass material, impulse and pressure to the LCD module should be avoided.
 - As the surface of the polarizer is very soft and easily scratched, use a soft dry cloth without chemicals for cleaning.
 - Do not pull the interface connector in or out while the LCD module is operating.
 - Put the module display side down on a flat horizontal plane.
 - Handle connectors and cables with care.
- (3) Cautions for the operation
 - When the module is operating, do not lose CLK, ENAB signals. If any one of these signals is lost, the LCD panel would be damaged.
 - Obey the supply voltage sequence. If wrong sequence is applied, the module would be damaged.
- (4) Cautions for the atmosphere
 - Dew drop atmosphere should be avoided.
 - Do not store and/or operate the LCD module in a high temperature and/or humidity atmosphere. Storage in an electro-conductive polymer packing pouch and under relatively low temperature atmosphere is recommended.
- (5) Cautions for the module characteristics
 - Do not apply fixed pattern data signal to the LCD module at product aging.
 - Applying fixed pattern for a long time may cause image sticking.
- (6) Other cautions
 - Do not disassemble and/or re-assemble LCD module.
 - Do not re-adjust variable resistor or switch etc.
 - When returning the module for repair or etc., Please pack the module not to be broken. We recommend to use the original shipping packages.
